Production Alert Recipients — Status + Handover Transfer (Amna's doc — Item 10, "Alert Ownership")

Date: 2026-08-17 **Project:** `nelc-elearning-platform-479319`

Current state — GOOD news: Amna is already a recipient of every alert

Amna's ask: "*Before handover, production alerts must not depend on your personal email/account. Please transfer all alerts to client-owned accounts and document how to modify the recipients.*"

Every existing GCP alert policy already notifies BOTH Amna + Ghulam. So at handover day, no alert channel needs to be *ADDED* — only Ghulam's channel needs to be *removed* (or kept as a secondary during transition).

GCP Cloud Monitoring notification channels

Channel	Email	Notes
Amna (PM)	`nelc.platform@gmail.com`	Client-owned (Amna's project inbox)
Ghulam (dev)	`ghulam@physioguidance.org`	Developer alias — under client-owned domain but mailbox controlled by developer

Both channels are wired into all **6 active alert policies**:

Policy	Fires when	Recipients
Site or API down (uptime check failing)	Backend or frontend down for ≥2 min	Amna + Ghulam
Backend 5xx spike (>20 in 5 min)	Server errors surging	Amna + Ghulam
Cloud Run Job execution failed	Any of 25 background jobs errors	Amna + Ghulam
Failed login burst (>30 in 5 min)	Possible brute-force / credential stuffing	Amna + Ghulam
Suspicious 403 burst (>50 in 5 min)	Auth-scan / crawler storm	Amna + Ghulam
Malware detected in uploaded file	ClamAV positive verdict	Amna + Ghulam

Uptime checks currently configured

- `physioguidance-backend` — checks `https://api.physioguidance.org/api/health/ready` every 60s from 6 global regions
- `physioguidance-frontend` — checks `https://physioguidance.org/` every 60s from 6 global regions

Both feed the "Site or API down" alert policy above.

Other alerting channels (outside GCP)

Sentry

- Backend project (physioguidance-backend) — currently sends "Issue Alert" emails to Ghulam's Sentry account inbox
- Frontend project (physioguidance-frontend) — same
- **Ownership status:** Sentry organisation is currently owned by Ghulam. Full transfer requires Amna to (a) accept an org invite as Owner and (b) then remove Ghulam. See `third-party-services-ownership.csv` for the ownership row.

GitHub Actions (CI deploy failures)

- Failure emails go to whoever pushed the failing commit + repo watchers
- Amna is already Owner of `physioguidance1-arch/physioguidance` — she can go to repo Settings → Notifications → Watch = "All Activity" to catch CI failures

Budget alerts (once configured — see budget-alert-status.md)

- Amna sets recipients directly on the budget in the console — she should **not** include Ghulam's email

---

How to remove Ghulam's channel on handover day (one command)

Do NOT run these until final handover — during the transition Ghulam still needs to see alerts to catch anything he might need to fix.

```
PROJECT=nelc-elearning-platform-479319
GHULAM_CHANNEL="projects/${PROJECT}/notificationChannels/15422204998454221054"

# Loop through every policy and remove Ghulam's channel
for POLICY in $(gcloud alpha monitoring policies list --project=$PROJECT --
        format="value(name)"); do
  # Get current channels, remove Ghulam's, update
  gcloud alpha monitoring policies update $POLICY \
    --remove-notification-channels=$GHULAM_CHANNEL \
    --project=$PROJECT
done

# Verify Amna is still on all policies
gcloud alpha monitoring policies list --project=$PROJECT --
        format="value(displayName,notificationChannels)" \
  | grep -c "12592801043257337597"  # Amna's channel ID — should equal total policy count

# Optional: also delete the channel itself
gcloud alpha monitoring channels delete $GHULAM_CHANNEL --project=$PROJECT
```

Recommended defense-in-depth (optional but ideal)

Instead of Amna's single Gmail (`nelc.platform@gmail.com`), create a **group alias** on her domain — e.g., `alerts@physioguidance.org` — that forwards to whoever is on-call at any given time (Amna today, someone else next year). Then a channel change on that alias updates all future recipients without touching GCP.

Set-up:

1. In Google Workspace (or wherever `physioguidance.org` is hosted): create a group `alerts@physioguidance.org` with Amna as the only member for now.
2. In GCP Monitoring → Notification Channels → New → Email → address = `alerts@physioguidance.org` .
3. In each of the 6 alert policies → replace `nelc.platform@gmail.com` with `alerts@physioguidance.org` .
4. Delete the old channel.

Effect: 100 alerts a year go to `alerts@physioguidance.org` . Amna reads them today. Next year she adds Ahmad as a member → all alerts also copy to Ahmad. No GCP change needed.

Summary matrix — Amna's Item 10 "Alert Ownership" ask

Sub-requirement	Status
Production alerts must not depend on developer email	🟡 **Amna is already primary recipient**. Ghulam is currently secondary. One-command removal on handover day (script provided above).
Document how to modify recipients	✅ **This document + inline commands**
Recommended defense-in-depth (group alias)	✅ **Documented above** (optional client-side action)
