1. How this guide is organised

This document walks through every capability a student has on PhysioGuidance. The sections follow the order of the sidebar inside the student dashboard, preceded by the public and pre-authentication flows a new visitor sees before they log in for the first time.

Every section names the exact page route the student visits, describes what the page shows, lists what the student can do on it as ordered steps, and — where useful for the client operations team — cites the backend endpoint that the frontend calls. Endpoint references are shown in monospace font so they are easy to distinguish from prose.

The platform runs on Next.js with the App Router. Routes are locale-prefixed. Wherever a route is shown below in the form `/[locale]/xyz`, substitute `en` for English or `ar` for Arabic — for example `/en/signup` or `/ar/signup`. The Arabic interface renders right-to-left with the full menu, forms, error messages, and PDF certificates translated.

---

2. Sign up — creating a student account

Route: `/[locale]/signup`. This page is open to the public and does not require any existing account.

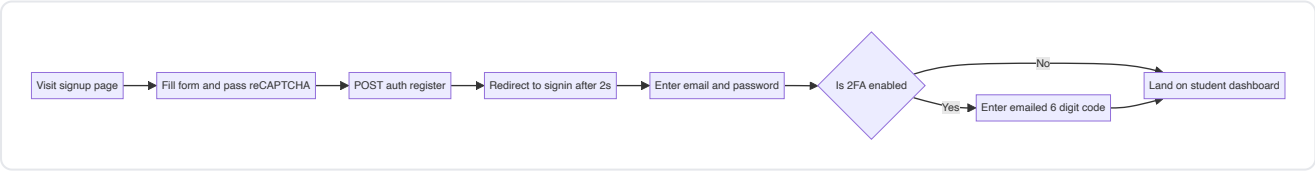

The signup form collects the following fields:

Field	Rules
First name	Required
Last name	Required
SCFHS registration number	Optional at signup. Recommended for CME learners — CPD certificates cannot be reported against a missing SCFHS number. Can be added later in Settings.
Saudi National ID or Iqama	Required. Must be exactly ten digits. Must begin with `1` (Saudi citizen) or `2` (resident). Validated server-side by `isValidSaudiNationalId`, which enforces the full checksum. This value is locked once accepted — see section 27.
Email	Required. Becomes the login identifier.
Password	Must satisfy the password policy configured by the platform admin (length, character classes, disallowed common values). Confirmed with a second field.
Terms and Privacy	Required checkbox. Acceptance timestamp is recorded on the account.
reCAPTCHA	Required. Blocks scripted signups.

Submitting the form calls `POST /auth/register`. On success the interface shows a confirmation message and redirects the student to the sign-in page after two seconds.

There is no email one-time password step at signup. The account is usable immediately with the chosen email and password. Two-factor verification is added later from Settings and only affects sign-in, not registration.

Signup and sign-in flow:

3. Sign in — email, password, and two-factor

Route: `/[locale]/signin`. Two-factor verification, when required, happens on the follow-up route `/[locale]/signin/verify`.

The sign-in form asks for email, password, an optional Remember me checkbox, and a reCAPTCHA challenge. Submission calls `POST /auth/login`. If the account has two-factor authentication turned on, the response indicates that a code has been sent and the browser is redirected to the verify page. The verify page accepts a six-digit code delivered by email and calls `POST /auth/verify-2fa`. A

Resend button is available and calls `POST /auth/resend-2fa` — the throttle on that endpoint prevents abuse.

Ticking Remember me instructs the platform to trust the current browser for a longer session and to add the device to the trusted devices list that the student can review in Settings. Untrusting a device from Settings forces a fresh two-factor challenge the next time it is used.

Only email-based two-factor is offered. SMS-based codes are not part of the flow.

---

4. Password recovery and admin-invited accounts

Route: `/[locale]/forgot-password`, `/[locale]/reset-password`, `/[locale]/set-password`.

If a student forgets their password, they visit the forgot-password page and submit their email address. The platform emails a signed reset link. Clicking that link opens the reset-password page, where the student chooses a new password that satisfies the policy and confirms it. The account is then usable with the new password.

When the operations team invites a new user directly from the admin dashboard (for example a bulk enrolment on behalf of a corporate client), the invited user receives an email link that opens the set-password page instead. This page has the same policy checks but is used for a first-time password rather than a recovery.

---

5. Cancelling a pending account deletion

Route: `/[locale]/account/cancel-deletion?token=…`.

If a student requested account deletion (see section 31) and changes their mind, the confirmation email includes a Cancel Deletion link that resolves to this route. The page reads the signed token from the URL and calls `POST /me/account/cancel-deletion` on the student's behalf. The account is immediately restored to its normal state, provided the thirty-day grace period has not expired.

Because the link is signed, no separate sign-in is required. This makes cancellation a single click even if the student is on a different device.

---

6. Language, locale, and layout

The whole platform supports English and Arabic. The locale is embedded as the first path segment on every page. Switching the language uses the language switcher available in the header and rewrites the

URL. A student's preferred locale is remembered on their profile and can be adjusted permanently in Settings.

Arabic pages render right-to-left. Certificates are generated in either language on demand at download time — the download endpoint accepts a `?lang=ar` or `?lang=en` query parameter (see section 20).

---

7. Public course catalog

Route: `/[locale]/courses`.

The catalog is open to the public. Students who are not signed in can still browse, filter, and view course detail pages. Every course card shows the title, cover image, instructor name, delivery type, CME hours, and price. Free courses are labelled Free. Courses that are outside their registration window are shown but marked as such and cannot be added to the cart.

Clicking a card opens the course detail page at `/[locale]/courses/[slug]`, which shows the full description, syllabus, live session schedule where applicable, instructor bio, and buttons for Add to cart or Buy now. The Add to cart action is handled by the client-side `CartContext` and persists the cart in the browser's localStorage — no backend call is made until checkout.

---

8. Course detail page and the shopping cart

Route: `/[locale]/cart`.

The cart page lists every course the student has added. Each line shows the course thumbnail, title, price, and a remove button. The cart's total is recomputed automatically. Because the cart lives in localStorage, closing the browser and returning later preserves the selection on the same device.

From the cart the student proceeds to checkout. If the student clicks Buy now from a course detail page instead of adding to cart, the checkout page opens in express mode by receiving the course id as a query parameter (`?expressCourseId=X`), skipping the cart step entirely.

---

9. Checkout — coupons, VAT, and gateway selection

Route: `/[locale]/checkout`.

At checkout the platform performs several server-side checks and calculations before offering payment.

First, it calls `GET /student/enrollment-status` to detect duplicate enrolments. A student who is already enrolled in a course in the cart is warned before payment, preventing accidental double purchases.

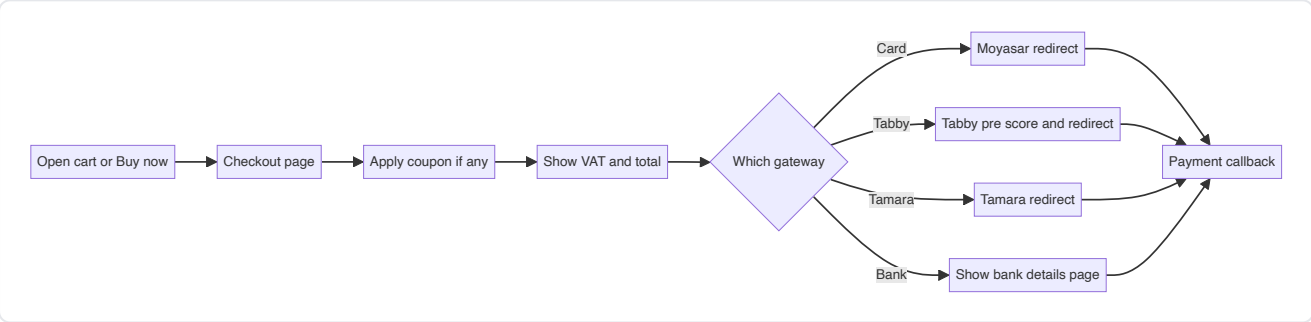

Second, if the student enters a coupon code, the frontend calls `POST /discounts/validate` and applies any valid discount to the total. Invalid or expired codes are rejected with a clear message.

Third, the summary displays the fifteen percent Saudi VAT breakdown and the final total in Saudi Riyal.

Fourth, the student selects one of the payment methods that the admin has enabled — see section 10. When Tabby is selected, the frontend performs a pre-scoring call to `POST /payments/tabby/pre-score` before showing the Tabby checkout, so that ineligible orders are caught early.

Finally the student confirms the order, which triggers `POST /payments/initiate`. This endpoint is rate-limited to ten requests per minute per user, which stops accidental double-submissions and protects the payment providers from spam.

Checkout flow:

---

10. Payment gateways — Moyasar, Tabby, Tamara, and Bank Transfer

The platform supports four gateways. Any subset can be enabled by the admin at runtime.

Gateway	Coverage	How the student pays
Moyasar	Credit or debit card, MADA, Apple Pay	Card details entered on the Moyasar hosted page, followed by 3-D Secure with the issuing bank, then a redirect back to the platform.
Tabby	Buy now, pay later, split into instalments	Pre-scoring runs first. Tabby's own KYC page then collects identity and confirms the instalment schedule. Redirect back on completion.
Tamara	Buy now, pay later, split into instalments	Redirects the student to Tamara's hosted checkout for identity and instalment agreement. Redirect back on completion.
Bank transfer	Direct bank transfer with manual finance approval	The student is shown the bank account details, transfers from their own bank, then uploads a proof-of-payment file. Finance approves or rejects it.

Card and BNPL flows settle in seconds once the third-party confirms success. Bank transfers wait on finance review; the uploaded proof of payment is scanned automatically by the platform's malware pipeline before finance sees it, and the enrolment activates only after finance approval.

---

11. Payment result pages

Routes: `/[locale]/payment/callback`, `/[locale]/payment/success`, `/[locale]/payment/failed`, `/[locale]/payment/bank-transfer/[paymentId]`.

The callback route receives the return from the gateway, reads its status, and forwards the browser to the success or failed page. The success page confirms the enrolment, links to the new course, and points to Billing for the invoice. The failed page names the failure reason where the provider supplies one and offers the student the choice of retrying with the same or a different method.

The bank-transfer route is unique. It is the page the student is sent to after choosing bank transfer at checkout. It shows the beneficiary account details, the reference number to include on the transfer, and the upload widget for the proof of payment. The student may leave this page open, complete the transfer, then upload the receipt.

---

12. Public certificate verification

Route: `/[locale]/verify/[certId]`.

Every certificate carries a public verification URL and a QR code encoding that URL. An external verifier — an employer, an auditor, or SCFHS itself — can visit the URL without a PhysioGuidance account and

see the certificate's authenticity, holder name, course, CME hours, and issue date. The route calls `GET /certificates/verify/:id`, which is throttled to thirty requests per minute per IP to prevent scraping.

---

13. Public invoice verification

Route: `/[locale]/verify-invoice/[number]`.

Similar to certificate verification, but for finance records. An auditor or the finance team of a corporate client can enter the invoice number and confirm that a PhysioGuidance invoice with that number was really issued, along with its amount and VAT breakdown. No account is required.

---

14. Applying to become an instructor

Route: `/[locale]/become-trainer` for the fully public flow.

A student who wants to teach on the platform has two paths.

The public flow at `/become-trainer` is unauthenticated. It uses a one-time password sent by email to verify the applicant, then collects a bio, CV, and credentials. This lets people apply to become an instructor without first opening a student account. The instructor guide covers this in detail.

An existing student can also apply from inside their dashboard using role requests. The frontend submits `POST /role-requests` with the application. The student can view their submissions via `GET /role-requests/mine` and, if a request was returned for changes, resubmit through `PATCH /role-requests/:id`. On approval the account is upgraded to the instructor role and the instructor sidebar becomes available at the next sign-in.

---

15. Student dashboard home

Route: `/[locale]/dashboard/student`.

This is the landing page after sign-in. It aggregates information the student needs at a glance.

The dashboard is composed of six widgets. The KPI stats tile shows totals for enrolled courses, completed courses, certificates earned, and CME hours accumulated. Continue Learning surfaces the courses with in-progress modules so the student can jump straight back in. Pending Assessments lists any assessment that has been started but not submitted or that is nearing its due date. Upcoming Schedule lists the next live sessions with Join buttons when they are within their joinable window. Recent

Grades shows the latest assessment results. Recommended Courses offers additional catalog entries chosen from the student's history.

A profile-completion or SCFHS-missing banner appears at the top when relevant. It nudges the student to add missing information that will later affect certificate reporting.

The dashboard fetches its data from `GET /student/dashboard`, `GET /student/courses?status=active`, `GET /student/calendar`, `GET /student/grades/recent`, and `GET /student/recent-activity`. The endpoints are called in parallel so the widgets render as soon as their data arrives.

The sidebar to the left of the dashboard is the primary navigation. It shows, in this exact order: Dashboard, Courses, Certifications, Favorites, Invite Friends, My Rewards, Support, Billing, Settings. A red dot appears next to Invite Friends when the student has unused coupons from redeemed rewards. The red dot on Support reflects the unread-badge count returned by `GET /me/sidebar-badges`.

---

16. My Courses — list, filters, and search

Route: `/[locale]/dashboard/student/courses`.

This page shows every course the student is enrolled in as a responsive grid. A search box filters by course title. Filter controls narrow the list by status (active, completed, dropped), by delivery type (live, self-paced, webinar), and by sort order (newest first, alphabetical). Each card links through to the course detail page.

The list is fetched from `GET /student/courses`.

---

17. Course detail — sessions, drop, and certificate request

Route: `/[locale]/dashboard/student/courses/[id]`.

The enrolled-student view of a course goes beyond the public catalog page. It presents the course overview, an accordion listing every module with its materials, and a schedule of live sessions where applicable.

Live sessions each have a Join button. Whether the button is active is decided by the `isJoinable` rule, which considers the current time relative to the session's start and end plus a small buffer. Clicking Join opens the Zoom link.

The student can drop the course from this page. The Drop Course button is gated by `canDropCourseNow`, which enforces the platform's course-cancellation policy — the button is available

only inside the window the admin has configured for that course.

The Request Certificate button is only enabled after the student has submitted both a course review and an instructor review through the review modal. This ensures a review is captured before a certificate is issued. See section 33 for the review flow.

A View Receipt link deep-links the student back into Billing at the specific payment that funded this enrolment, so the invoice or receipt can be retrieved with a single click.

---

18. Learn player — modules and materials

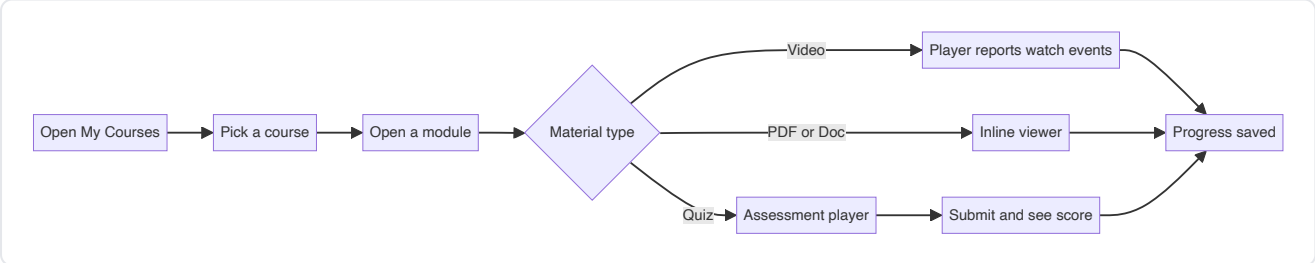

Route: `/[locale]/dashboard/student/courses/[id]/learn`.

The learn page is the full learner experience. It renders every material inside a module using the correct player for the content type.

PDFs render inline in an iframe. Office documents in Word, Excel, or PowerPoint format render through the Office viewer. Images display directly. Videos play through the platform's custom `VideoPlayer`, which reports watch events back to the server so the student's progress and time on task are captured accurately. Quiz materials and mixed-content materials launch the assessment player described in section 19.

The endpoints supporting the learn page are `GET /student/courses/:courseId/modules/:moduleId/materials`, `POST /student/materials/:id/watch-events`, and `POST /student/courses/:id/progress`. The watch-events endpoint receives periodic pings so playback can be resumed on the next visit exactly where it stopped.

Course learning and assessment flow:

---

19. Assessment player — quizzes and assignments

Route: `/[locale]/dashboard/student/courses/[id]/assessment/[assessmentId]`. A review of a graded submission is opened by appending `?review=true`.

The assessment player handles both timed quizzes and file-upload assignments in one interface.

For a timed quiz, the interface counts down the remaining time in the header. Answers are auto-saved to the server at a configured interval so an accidental refresh or network hiccup does not lose work. The student can flag a question to return to it later and jump between questions using the question navigator. When the student clicks Submit, the platform grades the objective questions immediately and shows the score. Manually-graded questions are marked as awaiting review and the final grade appears once the instructor completes marking.

For an assignment, the interface presents an upload widget. The student may attach up to ten files, each up to one hundred megabytes. The whitelist allows PDF, DOC, DOCX, JPG, PNG, WebP, GIF, MP4, MOV, MPEG, and WEBM. Every file is scanned by the platform's malware pipeline before it is delivered to the instructor.

Resumption is handled server-side. If a session ends mid-attempt, the student can return to the assessment and the interface restores the previous answers, the elapsed time, and any flags.

Opening the same route with `?review=true` shows the graded review: the student's answers, the correct answers where applicable, the instructor's per-question comments, and the total score.

The endpoints are `GET /student/assessments/:id` to load the definition, `POST /student/assessments/:id/save-progress` for auto-save, `GET /student/assessments/:id/progress` for resume, `POST /student/assessments/:id/submit` for a quiz submission, `POST /student/assessments/:id/submit-assignment` for an assignment submission, and `GET /student/submissions/:id/review` for the review view.

---

20. Certifications

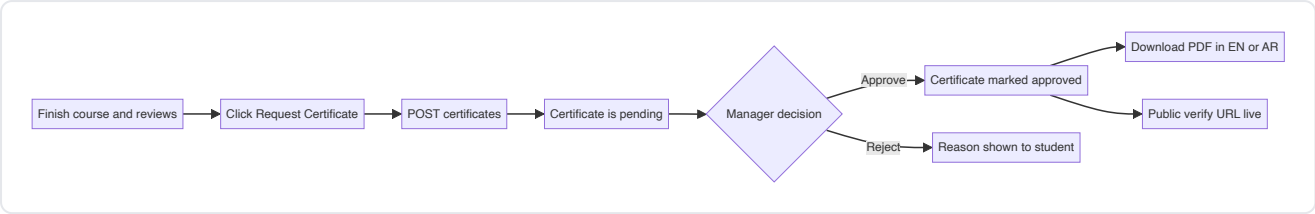

Route: `/[locale]/dashboard/student/certifications`.

The page lists every certificate the student has ever requested, along with its current state: pending, approved (available for download), rejected, held, or revoked. Filters at the top narrow the list by state.

For an approved certificate the student can download the PDF in either language by choosing the language button next to Download. The link uses `GET /student/certificates/:id/download?lang=ar` or `?lang=en`. The page also exposes the public verification URL for each certificate, which is what an employer or SCFHS auditor will open (see section 12).

A student initiates a certificate request from the course detail page (see section 17). The initial submission calls `POST /certificates`. The list itself is fetched by `GET /student/certificates`.

Certificate request, approval, and download:

21. Favorites (Wishlist)

Route: `/[locale]/dashboard/student/favourites`.

Favorites are the student's personal wishlist. The page lists every course the student has starred, with a search box across the saved list, a per-item remove button, and a Clear All action.

The list itself is entirely client-side. `FavouritesContext` persists the favorites to the browser's localStorage on the current device. When the page renders, it enriches the local list with fresh course data by calling the public catalog fetch `publicApi.getCourses`, so titles, prices, and cover images always reflect the current catalog even if the student starred a course months ago.

Because favorites are local to the browser, they are not shared across devices.

22. Invite Friends and the points program

Route: `/[locale]/dashboard/student/invite-friends`.

The URL keeps the legacy Invite Friends name so old bookmarks continue to work, but the page is the full points-and-rewards centre and is labelled My Points.

The page is composed of several widgets. PointsBalanceHero shows the student's current points balance. WaysToEarnGrid describes each earning rule that the admin has configured, so the student can see what actions grant points. RedeemPointsSection is the redemption hub. CoursesRedemptionGrid lists courses the student can unlock with points. RecentRewardsPreview and RecentActivityList show a running history of activity.

Points are earned according to the earning rules the admin has configured on the platform. Rules can grant points for actions such as completing a course, referring a friend, or leaving a review. The current rules are always visible on this page.

Points can be redeemed for course access, for coupon codes that discount a future purchase, or for other rewards catalogued by the admin. Redeeming a course access calls `POST /points/me/redeem-course/:courseId` and immediately grants the enrolment. Redeeming a coupon or a reward calls `POST /points/me/rewards/:id/redeem` and returns a redeemable coupon code.

Endpoints supporting the page are `GET /points/me`, `GET /points/me/balance`, `GET /points/me/rules`, `GET /points/me/transactions`, `GET /points/me/redeemable-courses`, `POST /points/me/redeem-course/:courseId`, `GET /points/me/rewards`, `POST /points/me/rewards/:id/redeem`, `GET /points/me/rewards/redemptions`, and `GET /points/me/rewards/history`.

---

23. My Rewards

Route: `/[locale]/dashboard/student/my-rewards`.

My Rewards is the wallet view of everything the student has redeemed through the points program plus their historical usage.

The page has two tabs. Active shows currently usable coupon codes, free-course grants, and free-webinar grants — anything the student can still apply. History shows past redemptions that have already been used or have expired. Each item displays its full metadata including the redemption date, the code itself with a copy-to-clipboard button, expiry information where applicable, and the item it was applied to when applicable.

Data comes from `GET /points/me/balance` and `GET /points/me/rewards/history`. The history endpoint projects every category into one unified feed — coupons, free-course grants, free-webinar grants, other rewards, and past course purchases — so the student sees one honest ledger.

---

24. Support tickets, FAQs, and tutorials

Route: `/[locale]/dashboard/student/support`.

The support page combines self-service help with a full ticketing workflow.

The self-service section surfaces the platform's frequently asked questions from `GET /student/faqs` and its video and text tutorials from `GET /student/tutorials`. Students are encouraged to search here first.

The ticketing section shows the student's own tickets grouped by status: All, New, In Progress, Resolved, and Closed. A New Ticket button opens the creation form. The form collects a subject, a category chosen from the admin-managed list, an optional related course, the message body, and any attachments. The category list is fetched from `GET /tickets/settings/ticket-categories?role=student`. Submitting calls `POST /student/tickets`.

Opening a ticket loads the full conversation thread from `GET /student/tickets/:id`. The student can post a reply through `POST /student/tickets/:id/reply` and, once support marks the ticket resolved, can rate the resolution from one to five stars through `POST /student/tickets/:id/rate`.

An offline banner appears at the top of the page during out-of-hours periods, driven by the business-hours configuration. The banner tells the student when to expect a response.

---

25. Billing — Overview, Payments, Invoices, Refunds

Route: `/[locale]/dashboard/student/billing?tab=overview|payments|invoices|refunds`. The page also accepts `?payment=<id>` to open a specific payment in a drawer, which enables deep links from emails and from the course detail page.

The billing page is organised into four tabs.

The Overview tab presents the finance policy summary — the refund policy the student is subject to, which gateways are currently available, and a plain-language explanation of the VAT and tax rules that apply to their purchases. It is powered by `GET /student/finance/overview` and `GET /student/finance/policy-snapshot`.

The Payments tab lists every payment the student has ever made. Each row expands into a drawer showing the per-line items, the gateway used, the transaction reference, and a receipt download button. A Request Refund button in the drawer opens the refund modal described in section 26. Endpoints backing the tab are `GET /student/finance/payments`, `GET /student/finance/payments/:id`, `GET /student/finance/payment-by-enrollment/:enrollmentId`, and `GET /payments/my-payments`.

The Invoices tab lists every invoice associated with the student's payments. A PDF download button is available for each, and the PDF can be produced in English or Arabic. Endpoints are `GET /invoices/my-invoices`, `GET /invoices/:id`, and `GET /invoices/:id/pdf`.

The Refunds tab lists every refund request the student has ever raised, with its current status: pending review, approved, refunded, or rejected. The list is fetched from `GET /refunds/my-refunds`.

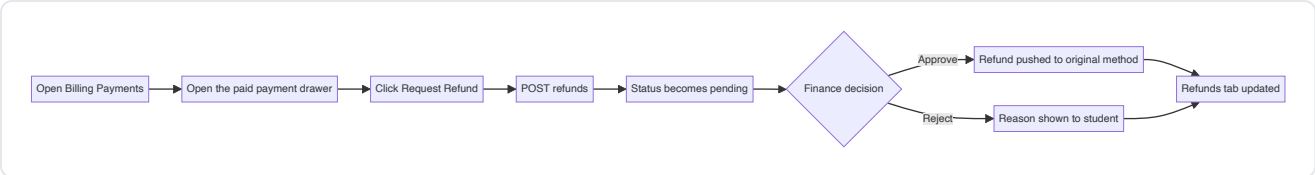

---

26. Requesting a refund

From the Payments tab of Billing, the student opens the drawer for a paid enrolment and clicks Request Refund. A modal collects the reason and any supporting notes and calls `POST /refunds` to file the request. The refund is created in pending state and appears immediately in the Refunds tab.

Refund eligibility itself is governed by the refund window that the course owner set on the course. Requests inside the window are considered by finance. Approved refunds go back through the same gateway that took the original payment. Bank transfer refunds are settled manually by finance.

Refund request and approval:

27. Settings — Profile tab

Route: `/[locale]/dashboard/student/settings` — the Profile tab.

The Profile tab is where the student manages the personal information stored on their account. Every field except the National ID is editable. The National ID or Iqama is locked once accepted — any attempt to change it is rejected by the server, which enforces this as a compliance rule.

Editable personal fields include first name and last name in English, first name and last name in Arabic, SCFHS registration number, gender, date of birth, phone number, and a short biography. Adding the SCFHS number here after signup is the recommended path for students who joined without one and now want CME certificates.

The tab also handles the account avatar. The student can upload a new image or remove the existing one. Uploads are scanned by the malware pipeline before they are attached to the profile.

A user-interface preferences block lets the student choose the preferred language, the preferred calendar (Gregorian or Hijri), and accessibility options. These are stored server-side and follow the student across devices.

Saving the profile calls `PATCH /auth/profile`. Saving user-interface preferences calls `PATCH /preferences/ui`.

28. Settings — Security tab

The Security tab groups every security-related control in one place.

Change Password takes the current password and a new password that satisfies the policy, then calls `PATCH /auth/change-password`. All active sessions on the account are invalidated on success so the student is signed back in with the new credentials.

The Two-Factor Authentication toggle turns email 2FA on or off through `POST /auth/2fa/toggle`. The current status is displayed from `GET /auth/2fa/status`. When 2FA is on, every future sign-in prompts for a six-digit code sent by email.

The Trusted Devices block lists every device that the student has previously used and marked as trusted. Each row shows the browser and operating system fingerprint plus the last-seen timestamp. The student

can remove a single device via `DELETE /auth/trusted-devices/:id` or clear the entire list via `DELETE /auth/trusted-devices`.

The Log Out Everywhere button ends every active session on every device by calling `POST /auth/logout-all`. Use it when a device has been lost.

---

29. Settings — Notifications tab

The Notifications tab is deliberately simple. It exposes exactly two master switches.

The Email master switch flips four underlying email preferences at once — for course updates, assessment reminders, certificate events, and finance events. The In-app master switch flips three underlying in-app push preferences at once. Turning a master off silences all four or three of its channels respectively. Per-event toggling is intentionally not offered to students; the platform uses two masters to keep the interface unambiguous.

The current settings are fetched by `GET /preferences` and updates are saved by `PATCH /preferences/notifications`.

Transactional messages required by law — invoice delivery, refund status, password resets, and account-deletion confirmations — always send regardless of the master switches.

---

30. Settings — Privacy tab

The Privacy tab implements the student-facing side of the platform's PDPL commitments. It is organised into three cards.

Consents card. The Marketing toggle turns marketing email on or off by calling `PATCH /me/consents/marketing`. The Sensitive Data toggle grants or withdraws consent for the platform to process sensitive personal data — this uses `POST /me/consents` for the grant and `POST /me/consents/withdraw` with type `sensitive_data` for the withdrawal. Below the toggles are read-only timestamps showing exactly when the student accepted the current Terms of Service and Privacy Notice. The card reads its current state from `GET /me/consents`.

Export data card. The student can download a complete JSON export of everything the platform stores about them through `GET /me/export`. The endpoint is rate-limited to one request per twenty-four hours per user to protect the database from repeated heavy queries. The export includes the account profile, enrolments, assessments, submissions, certificates, payments, invoices, refunds, ticket history, points history, and consent history.

Delete account (danger zone). This card opens the deletion modal covered in the next section.

---

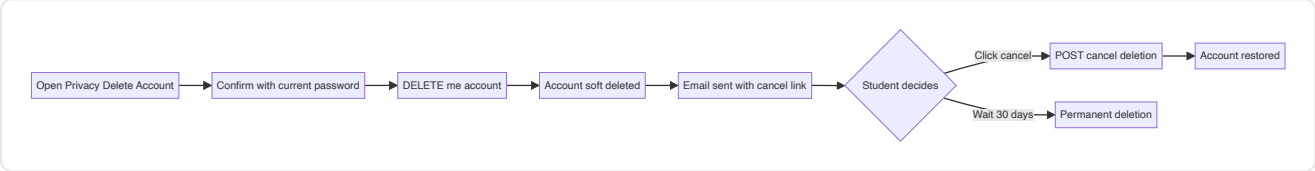

31. Requesting account deletion

From the Delete Account card in the Privacy tab the student opens a modal that requires the current password and an optional free-text reason. Confirming calls `DELETE /me/account`.

The delete is not immediate. The platform marks the account for deletion and enters a thirty-day grace period. Throughout the grace period the account is soft-deleted — the student cannot sign in, but the data is preserved and the deletion can still be cancelled. The confirmation email includes a signed cancel link that resolves to the cancel-deletion page described in section 5.

If the grace period expires without a cancel, the account is permanently deleted. Some records must be retained regardless — invoices, financial audit trails, and any legal-hold artefacts — because Saudi tax and audit law require their preservation. The platform keeps only what the law requires and severs it from the deleted profile where possible.

Account deletion, grace period, and cancellation:

32. Notification bell

The notification bell lives in the header of every authenticated page. It surfaces platform notifications independently of the email inbox — assessment reminders, session start-time alerts, certificate status changes, ticket replies, and platform announcements.

The bell shows an unread-count badge fetched from `GET /user-notifications/unread-count`. Opening the bell loads the notifications list from `GET /user-notifications`. Each item can be marked as read; a Mark All Read action clears the unread state in one call; a Clear All action removes the items from the list.

33. Course and instructor ratings

Two ratings are collected from every student who wants a certificate for a course: a rating of the course itself and a rating of the instructor. The review modal is presented when the student clicks Request Certificate on the course detail page.

The course rating is submitted through `POST /courses/:id/ratings`. The instructor rating is submitted through `POST /courses/:id/instructor-ratings`. Students who want to see their own already-submitted ratings can fetch them through `GET /courses/:id/ratings/me` and `GET /courses/:id/instructor-ratings/me`. Ratings must be submitted before the certificate request is accepted; this is the platform's way of ensuring that every issued certificate is preceded by feedback.

---

34. Session recordings

For live courses whose instructor has enabled recording, the recording appears against each session once it is processed. Students can list the recordings for a session through `GET /sessions/:id/recordings` and play them back inside the same viewer used for on-demand video, or download them where the instructor has permitted downloads.

---

35. Self-enrollment in free and open courses

For a course that is priced at zero and is open for registration, the student can enrol in a single click from the course detail page. The frontend calls `POST /student/enroll/:id` and the course appears in My Courses immediately. No checkout is needed and no payment record is created.

Bulk enrolments on behalf of a corporate client, teacher-led enrolments, and admin overrides are handled by other roles and are covered in the course-manager and admin guides.

---

36. Frequently asked questions

I signed up but never got any email — how do I sign in. Signup does not send a verification email. Return to the sign-in page and enter the email and password you chose. If the platform has enabled two-factor authentication for your account by default, it will send a six-digit code by email when you first sign in.

My card payment finished but my enrolment has not appeared. Card payments settle within seconds when 3-D Secure succeeds. Open Billing, then the Payments tab, and look for the transaction. Its status will indicate whether the gateway accepted or declined the payment. If the payment is missing entirely, try again. If your bank has already debited a payment that the platform did not record, open a support ticket from the Support page with the transaction reference from your bank statement.

Why can I not change my National ID or Iqama. The National ID is set once at signup and is locked afterwards. This is required for identity assurance under the platform's compliance rules and cannot be

bypassed by the student. If it was entered incorrectly at signup, open a support ticket and finance will correct it on the back office after verifying documents.

I forgot to submit the reviews and now I cannot request my certificate. Open the course from My Courses. On the course detail page, the Request Certificate button is deliberately gated by the course review and the instructor review. Submit both through the review modal and the button becomes available.

How do I download my certificate in Arabic. Open Certifications, find the certificate, and choose the Arabic download button. The PDF is generated in Arabic on demand.

I deleted my account by mistake — is my data gone. No, not yet. The account enters a thirty-day grace period. Check your inbox for the deletion confirmation email — it contains a signed cancel link that restores the account with one click. If you cannot find the email, open the cancellation page directly using the link on the sign-in page or contact support.

Where do I get an invoice for a payment I already made. Open Billing, then the Invoices tab. Every invoice is listed with a PDF download button. Invoices can be re-downloaded at any time and are available in both English and Arabic. If you paid by bank transfer the invoice is issued only after finance has approved the receipt.

A coupon code I earned from points is not applying at checkout. Open My Rewards and confirm the code is still on the Active tab. Codes that have already been used or expired appear on the History tab and are not usable. If a code on the Active tab still fails at checkout, copy it fresh from My Rewards using the copy button — trailing spaces from manual typing are the most common cause.

How do I stop marketing emails but keep receiving my receipts and certificate confirmations. Open Settings, then the Privacy tab, and turn off the Marketing toggle. Transactional emails such as invoices, refund updates, certificate confirmations, and password resets always send regardless of the toggle because they are legally required.

How do I export everything the platform stores about me. Open Settings, then the Privacy tab, then the Export Data card, then click Export. The export is rate-limited to one request per twenty-four hours. It bundles your profile, enrolments, assessments, submissions, certificates, payments, invoices, refunds, ticket history, points history, and consent history.

Can I access my materials on a phone. Yes. The learn player supports mobile browsers. Video controls, PDF viewers, and the assessment player all adapt to smaller screens. For long assessments, using a stable network is recommended because the auto-save call runs on a timer.

I lost my phone — how do I sign out from all my devices. Open Settings, then the Security tab. Click Log Out Everywhere. Every active session on every device is invalidated immediately. Then change your password.

37. Where to look next

For neighbouring information, refer to the other guides in this handover set.

The instructor guide (`instructor-guide.md`) covers the workflow behind live sessions, course creation, module setup, grading, and the trainer application flow that a student can use to become an instructor.

The admin guide (`admin-guide.md`) covers what happens on the operations side — payment gateway toggles, certificate approvals, refund approvals, user administration, and role management.

The finance guide (`finance-guide.md`) covers the finance operations that back the Billing tab a student sees, including reconciliation, refund workflow, and invoice generation.

The support guide (`support-guide.md`) covers how the support team handles the tickets that students submit, including categorisation, SLAs, and rating.

The course manager guide (`course-manager-guide.md`) covers the review and publication of courses, the approval of certificate requests, and management of the catalog that students browse.
